### **Team Member Contribution Journal**

Viktoriya Kurmisheva:

Ran all notebook code cells and checked the outputs to make sure the workflow worked correctly. Reviewed the code in each section and added explanatory comments to clarify the important steps, especially the more complex parts of the workflow. Modified the feature-selection list in the experimentation task to test a different combination of features and compare its effect on model performance. Completed all Question 1 items in the reflection section and two of the application scenarios in the “Think of Applications” section. After gathering learning insights from the other group members, wrote and organized the group’s reflective journal. Also reviewed the complete workflow to make sure the code, results, and written responses remained consistent.

Tien Manh Nguyen:

Completed all Question 2 items in the reflection section and answered Questions 2 and 3 in the Real-World Application Ideas section. Completed one of the application scenarios in the “Think of Applications” section. Reviewed code comments to confirm that they clearly explained the important steps and matched the purpose of the code. Then reviewed the completed notebook, including the written responses and outputs, to check for accuracy and completeness. After the final review, uploaded the completed .ipynb notebook to the group’s GitHub repository.

Zaid Alayeddy:

Handled all Question 3 items in the reflection section and completed Question 4 in the Real-World Application Ideas section. He also contributed one of the application scenarios in the “Think of Applications” section. As part of the final review, he checked the code comments to make sure they matched the code and explained the workflow clearly. He then gathered contribution details from each team member and used that information to prepare, review, and finalize the group’s contribution journal. Finally, he uploaded the contribution journal and related project materials to the group’s GitHub repository.
